

DISORDERS OF DEVELOPMENT

----- Active space -----

Assessment of development of the child

00:00:11

Developmental quotient :

$$\text{Developmental quotient} = \frac{\text{Developmental age (DA)}}{\text{Chronological age (CA)}} \times 100$$

- Developmental delay : $DQ < 70$.
- Global developmental delay : Delay in ≥ 2 domains $\rightarrow$ Significant neurological disorder (E.g : Cerebral palsy).

Evaluation of a preterm baby :

Corrected age = Postnatal age - Preterm correction.

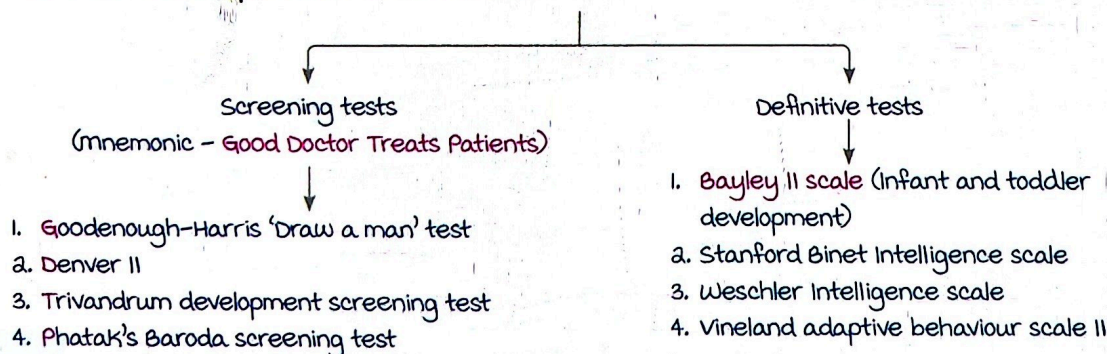

Preterm correction (Calculated upto 2 years) = 40 weeks - Actual weeks of gestation of preterm baby.

Red Flag Signs :

When a milestones takes longer than the upper limit to develop.

milestone	upper limit
Visual fixation or following	2 months
Head control	5 months
Vocalization	6 months
Sitting without support	10 months
Standing with support	12 months
• Standing/walking without support • Single words	18 months

Tests for Developmental Assessment :

Causes and Variants

00:09:30

Causes of Developmental Delay :**variants of Developmental Disorders :**

Developmental dissociation	Developmental deviance	Regression
Variation in attainment of milestones between ≥ 2 domains	Attainment of milestones out of normal sequence.	Loss of previously acquired milestone. 
Eg : Isolated language delay due to hearing deficit.	Eg : Early rolling (Head control later) over due to increase tone of extensors in cerebral palsy	Eg in : • Rett syndrome • Subacute sclerosing panencephalitis (SSPE) • Leukodystrophy
